19. ABSTRACT (Continue on reverse side if necessary and identify by block number) This report contains data from observations of meteorological and radiative parameters at selected satellite calibration target sites. These sites include the highly reflective gypsum field in southcentral New Mexico, a dark lava surface, a nearby fresh water reservoir and over desert terrain. The report also contains narrative descriptions of the instruments in use at the target sites.		

PREFACE

The data presented herein were collected for application to satellite calibration. However, the data represent a meticulous effort of simultaneous mesoscale observations of surface meteorological and radiative parameters, and as such, may be directly applicable to other, nonsatellite applications. Persons or organizations requiring these data on a week-by-week time schedule or for special observations in conjunction with specific satellite observations may write to:

METEOROLOGICAL SATELLITE CALIBRATION DATA	17

INTRODUCTION

The Atmospheric Sciences Laboratory (ASL) has broad objectives in the utilization of meteorological satellite data as applied to Army needs. A principal effort in the utilization of such data involves the development of techniques for quality assurance of the data collected by satellites. An example of the necessity of such assurance can be found in Taylor and Williamson.* Most satellite sensors cannot be manually manipulated or visually examined in orbit; therefore, methods of evaluating their output must be found to determine the performance of the instruments. To accomplish this, surface parameters which can form a catalog of ground truth data for comparison with satellite data must be collected at prescribed target sites.

A systematic effort has been underway since 1973. Sites and instrumentation were selected and acquired the first year, and data were collected the second and subsequent years. Data collection facilities are now in operation at four instrumentation sites (one on the lava flow, two on the white sands, and one on a fresh water surface). Measurements are made in adherence to a coordinated satellite overpass schedule and the Meteorological Rocket Network. The data published consist of information on several atmospheric and radiative parameters. All measurements are performed by qualified Army meteorological observers and civilian staff members. The data collected during 1977 constitute the bulk of this report and are preceded by a brief description of the instruments and technology used.

SITE DATA

Several target sites have been selected within and near White Sands Missile Range (WSMR), NM (Figure 1). These sites display a wide range of albedo and emissivity characteristics for empirical comparisons with satellite-derived data. Two of the target sites are on white gypsum sand for high albedo data and one is on a dark lava bed for low albedo data. One site on a water surface and one over desert terrain were also operated. Data from these sites are included in this report. A significant feature of the geography of these sites is that they underlie nearly the same atmosphere column when viewed from a satellite, all being located within approximately a 40-mile (64-km) radius.

WHITE SANDS SITE (METSAT I)

The White Sands site actually consists of three physical instrument locations (Figure 2). The White Sands area consists of a flat plain and an area of white gypsum and dunes. The demarcation between these areas is distinct, although this distinction is not always apparent in satellite data. The data site was selected so that from a centrally

*S. E. Taylor and L. E. Williamson, 1973, "Satellite Calibration Target Has Brightness Equivalent to Clouds," Bull. Am. Met. Soc., 54(6):551

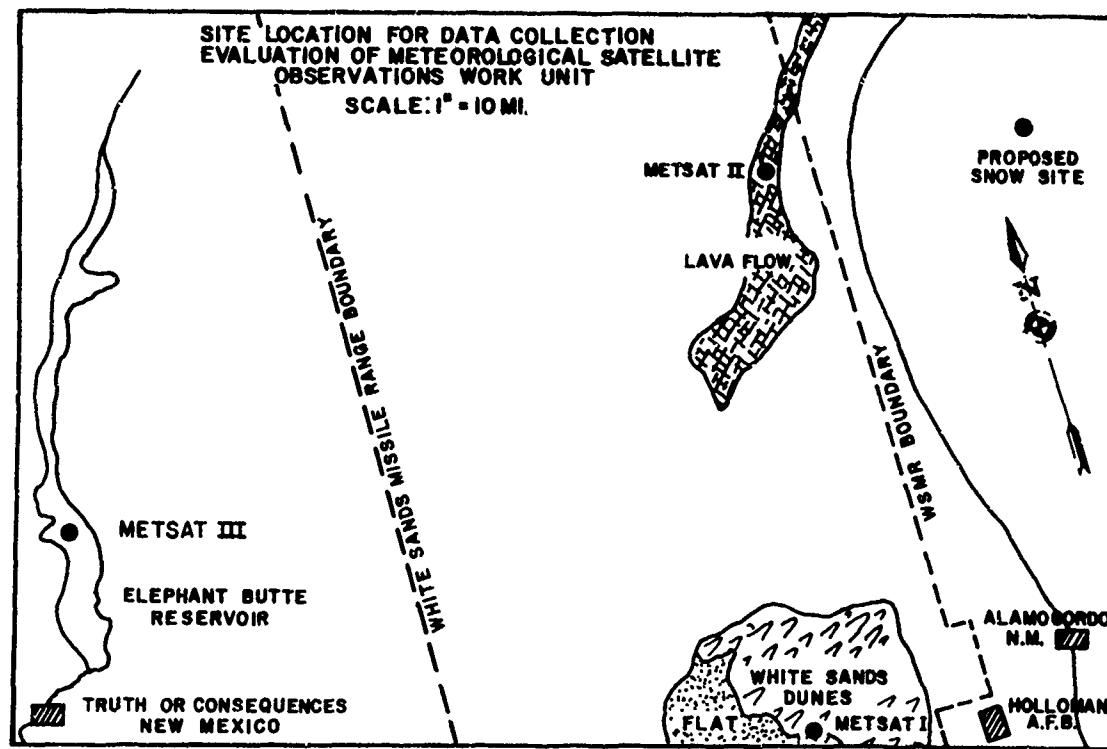

Fig. 1. General map of the WSMR Meteorological Satellite Evaluation System Target Sites in relation to each other and the WSMR boundaries.

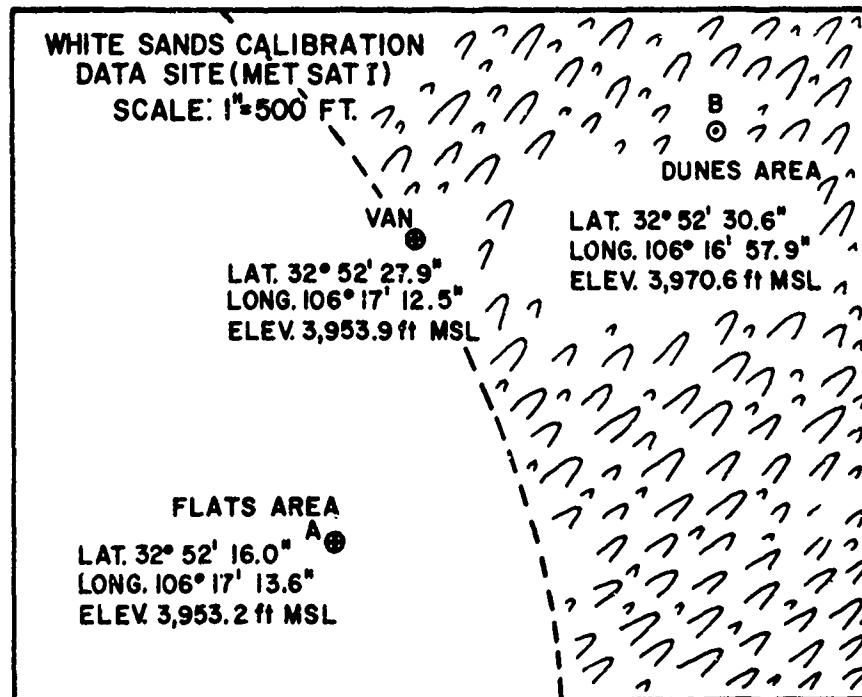

Fig. 2. Detail map of the METSAT I site showing the actual data collection points in relation to the terrain features.

instrumented location data could be collected from both the flat and the dunes areas. Locations A and B are the flats and dunes areas, respectively. Each of these locations contains an instrument mast from which outgoing spectral reflectance and surface radiant temperature data are collected. Soil temperature and soil moisture data are also acquired at each of these points. At the instrumented van, dynamic, thermodynamic, and incoming spectral radiation data are collected. Figure 2 also shows geodetic coordinates of the White Sands site.

LAVA BED SITE (METSAT II)

The lava bed site is located within the narrow portion of the lava bed which is approximately 40 miles (64-km) north of the METSAT I site. Spectral reflectance tests conducted via helicopter verified that the site was, generally, representative of the lava flow before it was qualified as a permanent site. The site is equipped with a complete set of instruments similar to those at METSAT I. Geodetic coordinates of the lava site are: latitude $33^{\circ} 28' 42.8''$ N, longitude $106^{\circ} 09' 17.3''$ W, and elevation 4,519.4 feet (1400 m) MSL.

WATER SITE (METSAT III)

The water site is located on the Elephant Butte Reservoir at latitude $33^{\circ} 13' 13.78''$ N, longitude $107^{\circ} 10' 48.89''$ W, and nominal elevation 4300 feet (1310 m) MSL.

DESERT SITE (METSAT IV)

The desert site is located approximately 7 miles (11.2 km) east southeast of the main post area of White Sands Missile Range at latitude $32^{\circ} 21' 11.0''$ N, longitude $106^{\circ} 22' 59.24''$ W, and an elevation of 3991 feet (1220 m) MSL. The area is typified by small sandy dunes with shrubs and desert vegetation.

INSTRUMENTATION

Since instrumentation systems installed at each site are as identical as possible, interpretative differences or implications are minimal. Each instrumentation system used on the calibration sites is described below to give the user a clearer understanding of the data. The order of discussion follows the listing on the data publication form (Figure 3) and is presented in two categories: meteorological (surface and upper air) and radiative.

METEOROLOGICAL

Surface

T_a - Air Temperature. These data are collected by a mercury-in-glass thermometer. Temperature is recorded on the standard form in degrees Celsius.

LEGEND

T_a = Air Temperature ($^{\circ}$ C); T_{dp} = Dew Point Temperature ($^{\circ}$ C); W_d, W_s = Wind Direction (deg.), Wind Speed (m/s); P = Station Pressure (In Hg); C = Sky Condition (symbolic); M = Precipitation (Yes/No); T_{a25}, T_{dp25} = Air Temperature ($^{\circ}$ C), Dew Point Temperature ($^{\circ}$ C) at 25 meter height.

Radiant Flux: Global Incoming: I = WG280, I_a = GG495, I_d = RG695
 Normal Incoming: N = WG280, N_a = GG495, N_d = OG530, N_c = RG630, N_d = RG695
 Global Outgoing: i = WG280, i_a = GG495, i_d = RG695

[Units: Milliwatts per square centimeter ($mW cm^{-2}$)]

T_{g/w} = Soil or Water Temperature ($^{\circ}$ C); T_s = Surface Temperature ($^{\circ}$ C); ψ = Soil Moisture (%); ε = Emissivity (%); E₁, A_Z = Solar Elevation, Solar Azimuth (degrees).

DRSEL-BL-MS 121, 28 Mar 75 (Rev.)

Figure 3. Format for Meteorological Satellite Calibration Data--1977.

T_{dp} - Dew Point. Dew point is evaluated from measurements of dry bulb and wet bulb temperatures.

Thermal data, T_a and T_{dp} , are collected approximately 2 m above ground.

$W_d W_s$ - Wind Direction and Speed. Wind direction and speed data are collected with a USWB F-420C airport wind indicator located 4 m above the surface. The direction is recorded in degrees and the speed in meters per second.

P - Pressure. Atmospheric pressure is determined by means of an H. E. Sostman and Company pressure transducer. The electrical output is observed on a digital voltmeter. The voltage value is modified by certain instrument constants provided by the manufacturer, and the resulting station pressure is entered on the data form in inches Hg.

C-Sky Condition (Sky Cover). This parameter is entered in typical meteorological format, and all cloud heights and amounts are visually estimated by qualified meteorological observers. The entry is made with conventional meteorological symbols.

M - Precipitation. The entry on the data form is "yes" or "no" to indicate whether precipitation has fallen on the site within the preceding 48 hours. This information is drawn from an examination of records from manned observation stations nearby.

T_{a25} and T_{dp25} . Air temperature and dew point of air sample drawn from the 25 m level. Data acquired at METSAT II only.

Upper Air

Rocketsonde Data. The upper atmospheric data acquired by rocketsondes which are included with the ground level are from the Meteorological Rocket Network Sounding Station at WSMR, NM. The rocket sounding is scheduled as nearly coincident with the satellite overpass as is compatible with the WSMR operational schedule. Generally, the time of rocket sounding will be within 1 hour. The coordinates of the rocket station are latitude $32^{\circ} 29' 07.78''$ N, longitude $106^{\circ} 21' 49.14''$ W. The launch direction of the rocketsondes is to the NW and deployment at altitudes of the rocketsonde instrumentation is generally in the vicinity of latitude $32^{\circ} 45'$ N, longitude $106^{\circ} 31'$ W.

Balloonsonde Data. The upper air data acquired by balloonsonde, which is included with the calibration data, are generally provided from the ASL Holloman Upper Air Section, Meteorological Station (within WSMR) and located at latitude $32^{\circ} 53'$ N, longitude $106^{\circ} 05'$ W.

RADIATIVE

I - Incoming Global Radiant Flux between 0.285 and 2.800 microns. An Eppley Precision Spectral Pyranometer (PSP) is used to collect these data. The data are collected in the form of millivoltage readings, which are then converted via manufacturer-supplied instrument constants to milliwatts per square centimeter (mW cm^{-2}). An Eppley White Glass Filter Dome (WG285) is used for this spectral band.

I_a - Incoming Global Radiant Flux between 0.500 and 2.800 microns. This measurement is identical to that of I, except that a yellow filter dome (GG495) is used on the PSP to permit only that radiation in the specified bandwidth.

I_d - Incoming Global Radiant Flux between 0.700 and 2.800 microns. A PSP with a red (RG695) filter dome is used. Data reduction and processing are identical to those of I and I_a .

N - Normal Radiant Flux between 0.285 and 4.000 microns. An Eppley Model 15 pyrheliometer with a fused silica filter is used to measure these data. After direct manual observation of millivoltage output plus the application of the instrument and conversion constants, the flux is recorded in milliwatts per square centimeter (mW cm^{-2}).

N_a - Normal Radiant Flux between 0.500 and 4.000 microns. Data are collected with a yellow (GG495) filter on the pyrheliometer.

N_b - Normal Radiant Flux between 0.530 and 4.000 microns. Data are collected with an OG530 filter on the pyrheliometer.

N_c - Normal Radiant Flux between 0.630 and 4.000 microns. Filter RG630 is used.

N_d - Normal Radiant Flux between 0.700 and 4.000 microns. Filter RG695 is used.

N_a , N_b , N_c , and N_d are collected as per N.

i - Outgoing Radiant Flux between 0.285 and 2.800 microns.

i_a - Outgoing Radiant Flux between 0.500 and 2.800 microns.

i_d - Outgoirg Radiant Flux between 0.700 and 2.800 microns. Outgoing flux data are collected with a set of Eppley PSP identical to those used to collect the incoming flux data. These instruments are mounted similarly to those used for I data, but are inverted and tower-mounted approximately 4 m above the ground surface.

The above set of radiative data includes flux values for 10 directly measured bands, each of which includes a portion of the visible and infrared bands (Figure 4). Arithmetic combinations of these values render additional spectral discriminations within several narrower bands. Additional data that are pertinent to radiation analysis are as follows:

$T_{g/w}$ - Soil/Water Temperature. This temperature is collected with a copper constantan thermocouple which is located from 1 to 4 mm below the ground or water surface. Its voltage value is observed on a meter and manually converted to temperature via references to the manufacturer's calibration chart. It is recorded on the standard data form in degrees Celsius.

T_s - Surface Temperature. The apparent radiant surface temperature is determined by a precision radiation thermometer [Barnes PRT-5 (9.5 - 11.5 micron)]. The temperatures are read directly from the instrument meters and recorded in degrees Celsius.

ψ - Soil Moisture. This parameter is currently determined gravimetrically for the White Sands sites. It is recorded in percent moisture of a soil sample taken from the upper 1 cm of the surface.

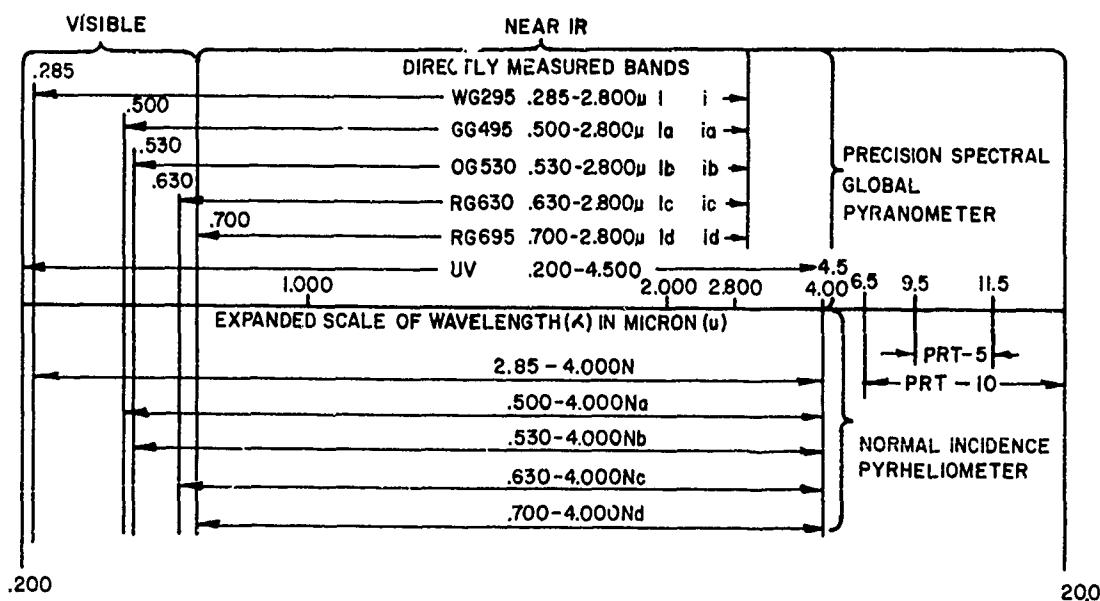

FIG. 4 MEASURED RADIATION BANDS REPORTED ON OBSERVATION FORM.

ϵ - Emissivity. This parameter is not routinely measured at each site. Measurements are being made of the entire area. The measurements technique involves the change in apparent radiant temperature of the test surface when the background radiation is artificially altered. When the emissivity map is completed, it will be published with the annual data report.

Special Instrumentation Data. Occasionally special requirements may exist for data from other sites, altitudes, or for other parameters. These data, when available, are included on the standard form and are individually identified.

Instrumentation Calibration. All primary instrumentation (sensors) are calibrated semiannually, and all secondary (sensors, recorders, meters, etc.) annually. An additional complete set of instruments is available for rotational service, and all instruments undergo additional calibration service if relocated and/or modified, e.g., filters changed.

DATA PROCESSING

Data Form. When the data are collected and reduced as described above, they are entered on a data sheet which includes certain radiosonde and rocketsonde data collected from nearby sites on WSMR. Radiosonde* and rocketsonde** data are presented in accordance with national standards. The current format for ground truth calibration data consists of the satellite identifier and a list of the data parameters and their units and the site locations.

Data Dissemination. Two primary distributions are used. Mailings are made weekly to those users who have requested to be placed on the mailing list. Special observations are made occasionally and the data are relayed via telephone or special mailings.

Data Publications. All data are cataloged for assembly and binding on an annual basis. A collection of a year's data is published in the form of an ERADCOM Technical Data Report. Special data collections will be assembled and published as special data reports, or included in the annual report, as appropriate.

*Federal Meteorological Handbook No. 4, Radiosonde Code, January 1972

**Federal Meteorological Handbook No. 10, Rocketsonde Observations, July 1975

Changes and Corrections. This report represents the fourth year of routine data collection under this program, and some changes in techniques and processes have been made. Where significant, these changes have been brought to the attention of the data users. The weekly observational schedule is made to coincide with specific satellite schedules. An observation coincident with NOAA series satellites will continue to be made on a weekly basis, and observations coincident with other satellites, i.e., NIMBUS, DMSP, as required.

REMARKS:

METSAT III, IV - not operated this date.

METSAT I, II - Normal Incoming measurements not made due to overcast sky conditions.

LEGEND

T = Air Temperature ($^{\circ}$ C); T_{dp} = Dew Point Temperature ($^{\circ}$ C); W_d, W_s = Wind Direction (deg.), Wind Speed (m/s); P = Station Pressure (In Hg); C = Sky Condition (symbolic); M = Precipitation (Yes/No); T_{a25}, T_{dp25} = Air Temperature ($^{\circ}$ C), Dew Point Temperature ($^{\circ}$ C) at 2^o meter height.

Radiant Flux: Global Incoming: I = WG280, I_a = GG495, I_d = RG695

Normal Incoming: N = WG280, N^a = GG495, N_d = OG530, N_c = RG630, N_d = RG695

Global Outgoing: i = WG280, i^a = GG495, i_d = RG695

(Units: milliwatts per square centimeter [$mW cm^{-2}$])

T_{g/w} = Soil or Water Temperature ($^{\circ}$ C); T_s = Surface Temperature ($^{\circ}$ C); ψ = Soil Moisture (%);

ε = Emissivity (%); E₁, Az = Solar Elevation, Solar Azimuth (degrees).
